

EVault Plug-in for Microsoft SharePoint

Key Benefits

- Customizable backups
- Hot backups
- Document-level recovery
- Data deduplication
- Centralized administration
- End-to-end security

Back up and recover Microsoft SharePoint portals and documents.

If your company uses Microsoft® SharePoint to collaborate, you need a reliable, secure, and easy-to-use way to back up this important IT asset, and to restore any portion of the critical digital assets held in SharePoint, right down to individual document version.

The EVault® Plug-in for Microsoft SharePoint helps you maximize productivity and ensure compliance with data retention regulations by protecting SharePoint portals and their assets for shared projects across your company.

Flexible and Efficient Backup Options

You can back up an entire portal or one or more site collections, ensuring that you only protect what is needed based on your business requirements. Hot backups of SharePoint enable day-to-day business operations to continue without interruption during the backup window. The plug-in leverages EVault delta block-level technology, speeding your backups and dramatically reducing bandwidth needs and storage costs by backing up only new and changed data blocks within SharePoint. All data is compressed before being transferred, significantly reducing your storage footprint and backup windows. Data deduplication decreases this further by eliminating duplicate data blocks within storage. To maintain security, backups are automatically encrypted in storage and in flight using government-grade AES encryption.

Granular Recovery

Beyond portal-level backup, you can recover specific components down to individual documents and document versions. With this level of granularity, your IT department can respond to requests to recover specific documents while SharePoint is still available to users, thus maximizing employee productivity.

How It Works: Backup

1. Using EVault CentralControl, install the plug-in on the SharePoint Server you want to protect. EVault Software centralizes backup and recovery of all computers distributed throughout an organization—local and remote.
2. An installation wizard helps you set backup dates, times and retentions. a disaster strikes, EVault experts will spring into action and act as your first line of defense.

EVault Plug-in for
Microsoft SharePoint

3. Thereafter, the EVault plug-in scans the SharePoint servers for changed blocks of data, compresses and encrypts them and transfers them to the backup Vault running on EVault Director.

How It Works: Restore

1. Simply select the version of documents or libraries to be restored and the destination for the restore—either back to SharePoint or directly to disk.
2. EVault Director assembles the restore as requested.
3. EVault Director sends the recovered image to the destination selected by you.

Feature	Function	Benefit
Customizable backup tasks	Portals, sites, sub-sites, lists, and specific document types can be backed up with a few mouse clicks.	Simplifies setting schedules to match policies.
Hot backups and recoveries	Conduct backups and recoveries while SharePoint remains operational and available to users.	Supports 24x7 operations.
Granular recovery capability	Recover an entire portal or specific portal components such as a site or sub-site, individual documents, and document versions. Attributes and user permissions are retained.	Flexibility to protect databases according to preference or need.
Flexible storage options	Create retentions based on business need. Store data in non-rewritable, non-erasable format (WORM).	Ensured compliance with privacy and security regulations.
Centralized administration	Enables customers to manage SharePoint backup and recovery through EVault CentralControl.	Quickly and efficiently recover what you need, and return to operations.
End-to-end security	Supports encryption of backup data and encryption of data in-transit and at rest.	Prevents security breaches.
Data deduplication	Eliminates duplicate blocks within backup jobs.	Reduces your storage footprint and helps you manage data growth.

EVault Agent

Scans the server for changed data and delivers those changes to the electronic vault.

EVault CentralControl

Enables remote management and configuration of all servers with Agents installed across a LAN or WAN environment from a web browser.

EVault Director

Powers the electronic vault, stores and catalogs the backup files and monitors the backup process.
